**Note:** DRIE-364

Export function.

In previous versions, exporting characters not belonging to the Italian/English alphabet (such as Russian alphabet, for example) was not allowed for the 'text' format. Characters differing from the ones belonging to the Italian/English alphabet would be exported with a "?" question mark.

Starting from this version it is possible to export to a text file according to the UTF-16 standard, which enables the printout of all characters of languages worldwide.

To use this feature, the 'Unicode mode?' field, which has been added to the detail of the 'I/E Logics' form, must be enabled
