Export function.

When exporting files in Microsoft Excel format, it is now possible to select the "XML" format, which is the one used by the most recent Excel versions (2010/2013/2016/2019). In order to use this new feature, it is necessary to set the 'File type' field to the value "Y, Excel XML format" in the detail section of the 'I/E Logics' form; in this case the default extension of the exported file is 'xlsx' and it is possible to create files containing up to 1,048,576 rows.
